## ABSTRACT

Air conditioning for residential comfort is important for human life for the early days of the changing weather climate that affects the temperature of the air temperature in residential dwellings. The air conditioning system is one of the business actions in the form of maintaining the temperature level in the room from the low level of the ambient temperature around it by absorbing heat from the material or room. The air conditioning load is also carried out to determine the AC capacity needed. Research conducted by the Glamour Mansion Tanjung Morawa Housing Complex using the method used is to calculate cooling capacity based on GA (General Arrangement) which includes several parameters, namely the number of people, number of windows, room volume, equipment, and heat from lights. So that the calculation of Heat Calculation, Air Capacity, and Cooling Capacity in a complex is obtained. From the results of the study it is known that the AC cooling load for the Glamour Mansion Tanjung Morawa Complex is the living room 1482 BTU / h, Room I 1953 BTU / h, Room II 800 BTU / h. 1 AC with a capacity of ½ PK in the room. 1 AC with a capacity of ½ PK in each room.

## PENDAHULUAN

Pengkondisian udara (Air Conditioning) merupakan kegiatan yang di dalamnya berupa pengolahan udara diatur untuk mendapatkan nilai cocok (ideal) yang kemudian di distribusikan menuju tempat huni orang didalamnya. Adapun pengaturan pengelolahan udara tersebut berupa suhu, kelembaban, dan kebersihan.

Untuk tempat hunian dikatakan bagus (nyaman) biasa mempunyai korelasi pada tingkatan kenyamanan penghuniya para penghuninya, dimana pada tempat hunian memiliki temperatur dan kondisi sirkulasi udara bersih terhadap ruangan tersebut diperlukan suatu alat pengkondisian udara (Air Conditioning). Perlu diperhatikan bawah energi yang di perlukan untuk penggunaan pengkondisian udara terbilang cukup besar disaat unit tersebut berjalan secara optimal, maka dari itu diperlukan suatu analisa pada tempat hunian/ruangan.

Indonesia disebut negara tropis dimana memiliki musim kemarau dan hujan, jadi sangat berpengaruh kepengkondisian udara rumah hunian dimana harus melakukan sistem pengaturan

pengkondisian udara untuk setiap musimnya untuk mencapai nilai ideal (thermal comfort) yang bertujuan para hunian dapat aktivitas dengan baik.

Untuk memperoleh kondisi lingkungan yang memenuhi kenyamanan termal perlu dipenuhi persyaratan tertentu dari lingkungan luarnya, masyarakat menggunakan sistem pendingin udara buatan (Air Conditioning). Pendinginan udara buatan ini berarti udara dalam ruangan dikondisikan sesuai dengan beban panas yang ada di dalam ruangan. Kondisi sejuk dan nyaman bagi manusia adalah kondisi dengan suhu 20°C sampai 25°C dan kelembaban 40 sampai 50%.

## URAIAN TEORI

### Pengkondisian Udara

Pengkondisian udara secara umum didefinisikan sebagai proses penyediaan dan pemeliharaan kondisi udara dalam ruangan yang diinginkan terhadap kondisi udara luar yang tidak diinginkan. Artinya pengkondisian udara tidak hanya mencakup proses pendinginan saja, tetapi juga proses pengolahan udara yang sekaligus mengatur suhu (pemanasan atau pendinginan), kelembaban (pengeringan atau pelembapan), kebersihan, kecepatan dan distribusi udara diperlukan dalam suatu ruangan.

Tujuan umum dari keberadaan sistem pengkondisian udara pada suatu gedung dapat terbagi atas 2 kelompok, yakni:

1. Pengkondisian udara yang nyaman (comfort air conditioning), khususnya pengkondisian udara dalam ruangan bertujuan memberikan tingkat kenyamanan termal kepada penghuninya, misalnya pada kawasan perumahan, tempat tinggal, hotel, bioskop, mobil.
2. Sistem Pengkondisian udara pada industri adalah tentang pengaturan sistem udara diruangan agar menjaga stabilitas suhu yang dibutuhkan. Penerapan sistem ini, digunakan dalam proses produksi sebagai contoh : penenunan berbagai bahan tekstil, dalam proses pencetakan, di ruang komputer, dll.

### Beban Eksternal, Internal dan Beban Total Ruangan

#### 1. Beban Eksternal (Luar)

Beban eksternal adalah beban sensibel berasal dari luar ruangan.

- a. Beban kalor oleh dinding luar

$$Q = U \times A \times CLTD_{corr}$$

Dimana : Q : Laju aliran kalor, BTU/hr  
U : Koefisien perpindahan panas (kalor) menyeluruh ,BTU/hr  
A : Luas penampang dinding, m<sup>2</sup>  
CLTD<sub>corr</sub> : Cooling Load Temperature Difference Corrected

- b. Beban kalor oleh dinding partisi

$$Q = U \times A \times CLTD_{corr}$$

Dimana : Q : Laju aliran kalor , BTU/hr  
U : Koefisien perpindahan panas (kalor) menyeluruh, BTU/hr  
A : Luas penampang dinding, m<sup>2</sup>  
CLTD<sub>corr</sub> : Cooling Load Temperature Difference Corrected

- c. Beban kalor melalui atap

$$Q = U \times A \times CLTD_{corr}$$

Dimana : Q : Laju aliran kalor yang diterima atap, BTU/hr  
U : Koefisien perpindahan panas (kalor) menyeluruh, BTU/hr  
A : Luas atap, m<sup>2</sup>  
CLTD<sub>corr</sub> : Cooling Load Temperature Difference Corrected

#### 2. Beban Internal (Dalam Ruangan)

Beban internal adalah beban pendingin yang bersumber dari dalam ruangan yang dikondisikan. Beban ini berasal dari sumber-sumber berikut:

- a. Beban kalor oleh manusia

$$Q = (qs \cdot n) \cdot CLF$$

$$Q = (ql \cdot n)$$

Dimana :  $Q$  : Besar kalor yang didapatkan dari manusia, BTU/hr.  
 $qs$  : Beban sensibel yang didapatkan dari orang, BTU/hr.  
 $ql$  : Beban laten yang didapatkan dari orang, BTU/hr.  
 $n$  : Jumlah orang.  
 $CLF$  : *Cooling Load Factor.*

- b. Beban kalor oleh peralatan

$$Q_{sensible} = q_{input} \times Fu \times Fr$$

Dimana :  $Q$  : Besar kalor peralatan, BTU/hr.

$q_{input}$  : Daya input peralatan, Watt.

$Fu$  : Faktor penggunaan, 1,0 atau kurang.

$Fr$  : Faktor radiasi, 1,0 atau kurang.

- c. Beban kalor dari penerangan

$$Q = 3,4 \times W \times BF \times CLF$$

Dimana :  $Q$  : Besar kalor penerangan, BTU/hr

$W$  : Kapasitas pencahayaan, Watt

$BF$  : *Ballast Factor* yang diizinkan untuk *fluorescent fixture*

$CLF$  : *Cooling Load Factor*

### 3. Beban Total Ruangan

Total beban ruangan yang dihasilkan terdiri beban kalor sensibel ruangan (RSHG) dan juga beban laten ruangan (RLHG) yang diperoleh dari penjumlahan total beban internal dan beban eksternal.

- a. Beban sensibel ruangan terdiri dari:

RSHG : Kalor Dinding + Kalor Atap + Partisi + Kalor Sensibel + Penghuni + Kalor Penerangan + Kalor Sensibel Infiltrasi

- b. Beban laten ruangan terdiri dari:

RLHG : Kalor Laten Orang + Kalor Laten Infiltrasi

- c. Beban total terdiri dari:

RTHG : RSHG + RLHG

## METODE PENELITIAN

### Tempat dan Waktu Penelitian

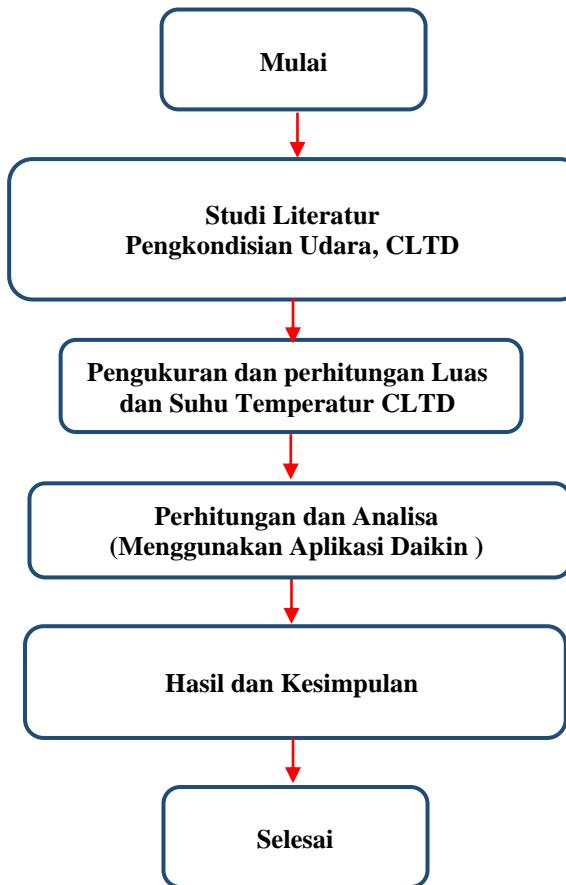

Pelaksanaan penelitian yang dilakukan bertempat di Laboratorium Multimedia Politeknik Tanjungbalai, dimana penelitian di laksanakan pada bulan April dan berakhir pada bulan Juni 2022.

### Prosedur Penelitian

Adapun prosedur penelitian yang dilaksanakan diuraikan dibawah ini:

1. Mengukur luas Laboratorium Multimedia Politeknik Tanjungbalai yang dijadikan objek penelitian.
2. Mengambil data suhu ruangan laboratorium multimedia beban yang menghasilkan panas pada ruangan.
3. Melakukan perhitungan cooling load pada ruangan laboratorium multimedia
4. Menghitung kebutuhan AC pada ruangan laboratorium multimedia dan beban pendinginan udara menggunakan aplikasi

### Diagram Penelitian

Gambar 1. Bentuk diagram alir pada penelitian yang dilaksanakan

## HASIL DAN PEMBAHASAN

### 1. Pengukuran Luas Ruangan Laboratorium Multimedia.

Untuk ruangan Laboratorium Multimedia Politeknik Tanjungbalai telah diukur bisa dilihat tabel 1 dibawah ini .

Tabel 1. Ukuran luas ruangan multimedia

Nama ruangan	P(ft)	L(ft)	T(ft)	A(ft <sup>2</sup> )	V(ft <sup>2</sup> )
Laboratorium Multimedia	16 m	8m	3m	128m	384m

### 2. Perhitungan Temperatur Beban Pendinginan (LCTD).

#### a. Beban Eksternal

Tabel 2. luas permukaan dinding dan atap

		Dinding				keterangan
Arah	Tipe dinding	P (ft)	T (ft)	Jumlah	A dinding	
	Dinding	52,5	10	1	525	Jumlah adalah luas
	Jendela	5,25	2	8	84	

Utara	Dinding partisi	29,5	10	1	295	dinding asli (luas dinding - luas jendela - dinding partisi)
	Jumlah					
Selatan	Dinding	52,5	10	1	525	Jumlah adalah luas dinding asli (luas dinding - luas jendela)
	Jendela	2,25	2	8	84	
	Jumlah					
Timur	Dinding	26,25	10	1	262,5	Jumlah adalah luas atap asli (luas atap - luas atap partisi)
Barat	Dinding	26,25	10	1	262,5

14	0,81	262,5	12,6	2679
15	0,81	262,5	18,2	3870
16	0,81	262,5	21	4465
Dinding Selatan				
8	0,81	441	13,2	4715,2
9	0,81	441	16	5715
10	0,81	441	18,8	6715
11	0,81	441	21,6	7717,75
12	0,81	441	24,4	8716
13	0,81	441	24,4	8716
14	0,81	441	21,6	7717,75
15	0,81	441	24,4	8716
16	0,81	441	24,4	8716
Dinding Utara				
8	0,81	146	2	236,5
9	0,81	146	2	236,5
10	0,81	146	4,8	567,7
11	0,81	146	4,8	567,7
12	0,81	146	7,6	898,78
13	0,81	146	10,4	1230
14	0,81	146	10,4	1230
15	0,81	146	14	1665,6

16	0,81	146	17,8	2105
<b>Dinding Timur</b>				
8	0,81	262,5	8,2	1743,5
9	0,81	262,5	8,2	1743,5
10	0,81	262,5	11	2338,87
11	0,81	262,5	13,8	2934,2
12	0,81	262,5	16,6	3530
13	0,81	262,5	19,4	4125
14	0,81	262,5	16,6	3530
15	0,81	262,5	16,6	3530
16	0,81	262,5	16,6	3530

Jadi total beban kalor terbesar setiap dinding adalah yang di tandai dengan warna kuning  
= Dinding Barat + Dinding Selatan + Dinding Utara + Dinding Timur

$$= 4465 \text{ Btu/hr} + 8716 \text{ Btu/hr} + 2105 \text{ Btu/hr} + 4125 \text{ Btu/hr}$$

$$= 19411 \text{ Btu/hr}$$

## 2. Beban Kalor Atap

Tabel 8. Beban kalor atap

Jam	U(Btu/hr-ft <sup>2</sup> °F)	A(ft <sup>2</sup> )	CLTDc(°F)	Q(Btu/hr)
<b>Atap</b>				
8	0,81	994,5	24,6	19816
9	0,81	994,5	24,6	19816
10	0,81	994,5	27,4	22071
11	0,81	994,5	30,2	24327
12	0,81	994,5	33	26583
13	0,81	994,5	33	26583
14	0,81	994,5	35,8	28838,5
15	0,81	994,5	41,4	33333
16	0,81	994,5	47	37841

Beban kalor dari atap yaitu terjadi pada pukul 16:00 adalah 37841 Btu/hr

## 3. Beban Kalor Dinding Partisi

Tabel 9. Beban kalor dinding partisi

Jam	U(Btu/hr-ft <sup>2</sup> °F)	A(ft <sup>2</sup> )	CLTDc(°F)	Q(Btu/hr)
<b>Dinding Partisi</b>				
8	2,70	295	2,2	1752,3
9	2,70	295	2,2	1752,3
10	2,70	295	2,2	1752,3
11	2,70	295	4	3186
12	2,70	295	4	3186
13	2,70	295	5,8	4619,7
14	2,70	295	7,6	6053,4
15	2,70	295	5,8	4619,7
16	2,70	295	7,6	6053,4

Beban puncak kalor dari dinding partisi yaitu terjadi pada pukul 14:00 dan 16:00 adalah 6053,4 Btu/hr

**b. Beban Internal**

## d. Beban Total Ruangan

Beban sensibel ruangan ialah

$$\begin{aligned}
 RSHG &= 19411 \text{ Btu/hr} + 37841 \text{ Btu/hr} + 6053,4 \text{ Btu/hr} + 5500 \text{ Btu/hr} + 2040 \text{ Btu/hr} + \\
 &\quad (79,2 + 79,2) \text{ Btu/hr} \\
 &= 71003,8 \text{ Btu/hr}
 \end{aligned}$$

Beban laten ruangan ialah

$$\begin{aligned}
 RLHG &= 9500 \text{ Btu/hr} + (197,88 + 197,88) \text{ Btu/hr} \\
 &= 10093,64 \text{ Btu/hr}
 \end{aligned}$$

Beban total ruangan ialah

$$\begin{aligned}
 RTHG &= 71003,8 \text{ Btu/hr} + 10093,64 \text{ Btu/hr} \\
 &= 81097,44 \text{ Btu/hr}
 \end{aligned}$$

3. Perhitungan Beban Pendinginan menggunakan aplikasi Daikin.

1. Pertama masuk/akses aplikasi DAIKIN
2. Kemudian masukkan data perancangan ruangan

## PENUTUP

Dari hasil pengukuran dilapangan dan perhitungan bahwa nilai kapasitas beban pendinginan menggunakan metode praktis perdasarkaan arah posisi dan dengan menggunakan aplikasi pada ruangan Laboratorium Multimedia Politekinik Kota Tanjungbalai, didapatkan kesimpulan :

1. Ruangan Laboratorium Multimedia Politekinik Kota Tanjungbalai memiliki luas 314,4 m<sup>2</sup> dan terdapat banyak beban yang menghasilkan panas didalam ruangan.
2. Kapasitas beban pendinginan yang di hitung secara manual untuk Ruangan Laboratorium Multimedia Politekinik Kota Tanjungbalai adalah 81097,44 Btu/hr.
3. Kapasitas beban pendingin yang di hitung menggunakan aplikasi DAIKIN untuk ruangan Laboratorium Multimedia Politekinik Kota Tanjungbalai adalah 38020 BTU/hr.
